## RESEARCH INTERESTS

My research interests encompass the uptake and translocation of inorganic elements within the transport system of vascular plants. Of major interest is the use of growth factors and chelating agents to enhance the metal translocation from the roots to the leaves and the effects produced on the whole-plant element accumulation. Another two research areas of interest include (1) the use of plant growth promoting bacteria for plant nutrition and phytoremediation purposes and (2) the bioproduction of nanoparticles using living plants and inactivated plant biomass. The long-term goals are (a) to characterize plants useful for phytoremediation and to determine the biochemical/molecular molecules associated with elements uptake. (b) To produce and recover nanoparticles from both living and inactivated plant tissues. Instrumentation utilized in these types of studies includes inductively coupled plasma/optical emission spectroscopy (ICP/OES), X-ray absorption spectroscopy (XAS), and infrared imaging microspectroscopy.
